***Priority***

Receipt is acknowledged of a certified translation of foreign priority document submitted on 6/22/09, which have been placed of record in the file.

***Allowable Subject Matter***

In regard to claim 1, none of the prior art of record alone or in combination discloses or suggests an optical pickup apparatus for recording and/or reproducing main information by irradiating with light a recording medium formed of a plurality of recording layers, the optical pickup apparatus comprising:

a light source;

a light collector configured to collect emitted light emitted from the light source onto one recording layer of the recording medium, the light collector being provided so as to be displaceable in a variable direction perpendicular to an optical axis of the emitted light within a movable range including a neutral position centering on the optical axis of the emitted light led to the light collector, the light collector being configured to change, by the displacement in the movable direction, a light collection position in the recording medium of the emitted light;

a light receiver configured to receive reflected light reflected by the recording medium, the light receiver having first and second light receiving portions configured to obtain track position information which is information of the light collection position of the emitted light with respect to a direction parallel to the recording layer, and shift information of the light collector from the neutral position, and a third light receiving portion configured to obtain focus position information which is information of the light collection position of the emitted light with respect to a direction perpendicular to the recording layer;

a splitter having a first splitting portion, a second splitting portion, and a third splitting portion, configured to lead the reflected light via the light collector and split the reflected light on the respective first to third splitting portions, the first splitting portion leading the reflected light to the first light receiving portion, the second splitting portion leading the reflected light to the second light receiving portion, the third splitting portion leading the reflected light to the third light receiving portion, the first and second splitting portions being disposed in a residual region excluding an axial vicinity portion in a vicinity of a splitting axial line corresponding to an optical axis of the reflected light led to the splitter when the light collector is located at the neutral position, wherein the axial vicinity portion is formed in a region including a mobilization regional portion at the time that a radiation range of the reflected light reflected by other recording layers is displaced along with the displacement of the light collector, in a case where the radiation range of the reflected light reflected by the other recording layers except for the one recording layer is smaller than a radiation range of the reflected light reflected by the one recording layer; and

a controller configured to obtain the track position information and shift information by a result of light reception by the light receiver and control the light collection position of the emitted light in the recording medium by controlling a position of the light collector based on the track position information and shift information.

Accordingly, claims 1 and 3-9 are allowed.
